TITLE
PROCESS FOR THE PRODUCTION
OF FLUOROCARBONS
FIELD OF THE INVENTION

5 The present invention relates to the synthesis of hexafluoropropylene and 1,1,1,2,3,3,3-heptafluoropropane.

BACKGROUND

Commercial methods for the preparation of hexafluoropropylene (CF₃CF=CF₂ or HFP), a fluoromonomer, typically involve temperatures greater
10 than 600°C. The high reaction temperatures lead to the formation of perfluoroisobutylene, an extremely toxic compound which is costly to remove and destroy (e.g., see European Patent Application No. 002,098). Processes for the manufacture of HFP at lower temperatures based on the use of acyclic three-carbon hydrocarbons or partially halogenated three-carbon hydrocarbons are
15 disclosed in U.S. Patent Nos. 5,043,491, 5,057,634 and 5,068,472.

1,1,1,2,3,3,3-Heptafluoropropane (CF₃CHFCF₃ or HFC-227ea), a fire extinguishant, can be prepared by the reaction of HF with HFP in contact with activated carbon (e.g., see British Patent Specification No. GB 902,590). The manufacture of HFC-227ea in this instance is tied to the availability HFP.

20 There is a need for alternative methods of manufacturing HFP and HFC-227ea.

SUMMARY OF THE INVENTION

A process is provided for the manufacture of hexafluoropropylene and 1,1,1,2,3,3,3-heptafluoropropane. The process comprises (a) feeding
25 1,1,2-trichloro-3,3,3-trifluoropropene-1 (CCl₂=CClCF₃), HF and Cl₂ to a first reaction zone containing a catalyst comprising trivalent chromium and operating at a temperature of at least 250°C, but not more than about 325°C, to produce a reactor effluent comprising C₃Cl₃F₅, C₃Cl₂F₆, CF₃CClFCF₃, HCl and HF;
(b) distilling the reactor effluent of (a) to produce (i) a low boiling stream
30 comprising HCl, (ii) a reactant stream comprising an azeotrope of 2-chloro-1,1,1,2,3,3,3-heptafluoropropane HF and (iii) a high-boiling stream comprising C₃Cl₂F₆ and C₃Cl₃F₅; (c) reacting the 2-chloro-1,1,1,2,3,3,3-heptafluoropropane of reactant stream (ii) with hydrogen in the presence of a catalyst to produce a mixture comprising hexafluoropropylene and 1,1,1,2,3,3,3-heptafluoropropane;
35 (d) feeding the C₃Cl₂F₆ and C₃Cl₃F₅ of high boiling stream (iii) along with HF to a second reaction zone containing a catalyst comprising trivalent chromium and operating at a temperature of at least about 375°C to produce a reaction product comprising CF₃CClFCF₃ and HF; and (e) recycling the reaction product of (d) to the first reaction zone.

BRIEF DESCRIPTION OF THE DRAWING

Fig. 1 is a schematic flow diagram of an embodiment of the process of this invention.

DETAILED DESCRIPTION

5 The present invention involves the use of $\text{CCl}_2=\text{CClCF}_3$ and $\text{CF}_3\text{CClFCF}_3$ in combination as materials for producing $\text{CF}_2=\text{CFCF}_3$ and CF_3CHF_3 . The process of the invention uses an azeotropic composition of $\text{CF}_3\text{CClFCF}_3$ and HF as a precursor to the desired products. Further information on such azeotropes is provided in U.S. Patent Application No. _____ [CL-1158-P1], which is hereby
10 incorporated by reference herein.

$\text{Cl}_2=\text{CCl}_2\text{CF}_3$, a feed material for step (a) above, may be derived, for example, by the chlorofluorination of hexachloropropylene. At least a portion of the $\text{CF}_3\text{CClFCF}_3$ is derived in accordance with step (d) above.

Figure 1 is illustrative of one method of practicing this invention.

15 Referring to Figure 1, a feed mixture comprising hexachloropropylene (i.e., $\text{CCl}_2=\text{CClCCl}_3$ or HCP), chlorine and hydrogen fluoride and where the HF:HCP molar ratio is about 3:1, or more (the Cl_2 :HCP ratio is typically about 1:1, or more), is passed through line (110) into reactor (100). Liquid phase, vapor phase or trickle bed reactors can be used. For the liquid phase and trickle bed reactors
20 the reaction temperature is at least about 25°C. The trickle bed reactors are usually packed, e.g., with carbon, or can contain bubble trays; both modes are well known in engineering practice. For the vapor phase reactors, which can be either empty or packed (e.g., with carbon), the minimum reaction temperature is at least 150°C. The $\text{CCl}_2=\text{CClCF}_3$ starting material of step (a) can also be obtained by
25 the chlorofluorination reaction of 2-fluoropropane over a divalent cobalt on an activated carbon catalyst as described in U.S. Pat. No. 3,865,885.

30 The reactor effluent from chlorofluorination reactor (100) comprising 1,1,2-trichloro-3,3,3-trifluoropropene-1 (i.e., $\text{CCl}_2=\text{CClCF}_3$ or FC-1213xa), chlorine, HF and HCl is passed through line (120) into line (510) where it is combined with the reaction effluent from reactor (500). The reactor (500) effluent comprises 2-chloro-1,1,1,2,3,3,3-heptafluoropropane (i.e., $\text{CF}_3\text{CClFCF}_3$ or CFC-217ba), HCl and HF.

35 The combined (100) and (500) reactor effluents are sent to reactor (200) which is maintained at a temperature within the range of about 250°C to about 325°C. Reactor (200) is packed with a catalyst comprising trivalent chromium. Additional HF may be added, if required. A preferred catalyst is Cr_2O_3 prepared by the pyrolysis of $(\text{NH}_4)_2\text{Cr}_2\text{O}_7$ as described in U.S. Patent No. 5,036,036.

The reactor (200) effluent comprising HF, $\text{C}_3\text{Cl}_3\text{F}_5$, $\text{C}_3\text{Cl}_2\text{F}_6$ and C_3ClF_7 is sent through line (210) into distillation column (300). The $\text{C}_3\text{Cl}_3\text{F}_5$ component

is mainly composed of $\text{CClF}_2\text{CCl}_2\text{CF}_3$, $\text{CCl}_2\text{FCClFCF}_3$ and a small amount of $\text{CClF}_2\text{CF}_2\text{CClF}_2$. The $\text{C}_3\text{Cl}_2\text{F}_6$ component is mainly composed of $\text{CF}_3\text{CCl}_2\text{CF}_3$ and $\text{CClF}_2\text{CClFCF}_3$ and small amounts of $\text{CClF}_2\text{CF}_2\text{CClF}_2$. The C_3ClF_7 component is mainly composed of $\text{CF}_3\text{CClFCF}_3$. HCl and other low boiling components are removed through line (320) and the remainder of the reactor (200) effluent is sent through line (310) into a second distillation column (400). The bottom fraction from column (400) which comprises HF, $\text{C}_3\text{Cl}_3\text{F}_5$ and $\text{C}_3\text{Cl}_2\text{F}_6$ is sent through line (430) into reactor (500) which is maintained at a temperature of at least about 375°C . The reactor is packed with a catalyst comprising trivalent chromium. A preferred catalyst is the above-described Cr_2O_3 prepared by pyrolysis of $(\text{NH}_4)_2\text{Cr}_2\text{O}_7$. The effluent from reactor (500) comprising HCl, HF and CFC-217ba is removed through line (510) and sent to reactor (200).

HF/CFC-217ba azeotrope is removed from the top of column (400) through line (410). HF/CFC-217ba azeotrope is passed through line (420) into catalytic reactor (600) along with hydrogen which is fed through line (610). The reactor (600) product is removed through line (620) and comprises, HCl, HF, hexafluoropropylene (i.e., $\text{CF}_3\text{CF}=\text{CF}_2$ or HFP) and 1,1,1,2,3,3,3-heptafluoropropane ($\text{CF}_3\text{CHF}_2\text{CF}_3$ or HFC-227ea). The hydrogenolysis of step (c) may be conducted in the presence of HF. HFP and HFC-227ea can be isolated by conventional means. A portion of the azeotrope can be taken off through line (410) for other uses (e.g., the manufacture of $\text{CF}_3\text{CF}_2\text{CF}_3$).

The fluorination catalyst employed in steps (a) and (d) of the process of the invention may be supported or unsupported. Any of the fluorination catalysts described in the prior art may be used such as oxides, halides and oxyhalides of aluminum, cobalt, manganese, iron and particularly chromium. Suitable chromium-containing catalysts include oxide, hydroxide, oxyhalide, halides, inorganic acid salts, basic chromium fluorides and especially preferred are the chromium oxide catalysts described in U.S. Pat. No. 5,036,036. The catalysts may be given a prefluorination treatment by passing hydrogen fluoride, with or without an inert diluent such as nitrogen, over the catalyst at a temperature within the range of about 250 to 450°C prior to use.

The operating pressure of the process of the invention is dependent on the product isolation scheme employed and is generally within the range of from about 101 kPa to about 5000 kPa.

The reaction zone of steps (a) and (d) may consist of one or two reactors.

CFC-217ba may be reacted with hydrogen to form a product comprising HFP and HFC-227ea by contacting the CFC-217ba with hydrogen at an elevated temperature in the vapor phase over a catalyst comprising at least one component selected from the group consisting of elemental metals, metal oxides, metal

halides and metal oxyhalides; wherein the metal of said hydrodehalogenation catalyst component is selected from copper, nickel, chromium and mixtures thereof and the halogen of said halides and said oxyhalides is selected from fluorine, chlorine and mixtures thereof. Greater details of the reaction with
5 hydrogen are described in U.S. Patent No. 5,057,634 which is incorporated herein by reference. Another useful catalyst comprises a three-dimensional matrix carbonaceous material such as that described in U.S. Patent No. 4,978,649.

Alternatively, CFC-217ba can be converted to a product comprising HFC-227ea and HFP by contacting CFC-217ba with hydrogen at an elevated
10 temperature in the vapor phase over a catalyst comprising at least one metal selected from the group consisting of rhenium, ruthenium, rhodium and palladium. The reaction temperature for these metal-containing catalysts is at least about 100°C. The reaction temperature when other catalysts are used is normally at least about 300°C. In any case, the reaction temperature is normally
15 less than 500°C.

The reaction pressure is normally within the range of about 100 kPa to about 7000 kPa. Typically, the mole ratio of hydrogen to CFC-217ba is from 0.5:1 to 25:1, preferably from 1:1 to 5:1.

Those skilled in the art will recognize that since the drawings are
20 representational, it will be necessary to include further items of equipment in an actual commercial plant, such as pressure and temperature sensors, pressure relief and control valves, compressors, pumps, storage tanks and the like. The provision of such ancillary items of equipment would be in accordance with conventional chemical engineering practice.

The reaction zone and its associated feed lines, effluent lines and
25 associated units should be constructed of materials resistant to hydrogen fluoride and hydrogen chloride. Typical materials of construction, well-known to the fluorination art, include stainless steels, in particular of the austenitic type, the well-known high nickel alloys, such as Monel® nickel-copper alloys, Hastelloy®
30 nickel-based alloys and, Inconel® nickel-chromium alloys, and copper-clad steel.

Without further elaboration, it is believed that one skilled in the art can, using the description herein, utilize the present invention to its fullest extent. The following specific embodiments are, therefore, to be construed as merely
illustrative, and do not constrain the remainder of the disclosure in any way
35 whatsoever.

General Procedure for Product Analysis

20 The following general procedure is illustrative of the method used. Part of the total reactor effluent was sampled on-line for organic product analysis using a Hewlett Packard HP 5890 gas chromatograph equipped with a 20' (6.1 m) long x 1/8" (0.32 cm) diameter tubing containing Krytox[®] perfluorinated polyether on an inert carbon support and within a flame ionization detector. The helium flow was 25 35 mL/min. Gas chromatographic conditions were 70°C for an initial hold period of three minutes followed by temperature programming to 180°C at a rate of 6°C/minute.

The bulk of the reactor effluent containing organic products and also inorganic acids such as HCl and HF was treated with aqueous caustic prior to 30 disposal.

EXAMPLE 1Chlorofluorination of FC-1213xa

Chromium oxide (47.25 g, 35 mL, 10-20 mesh, (2.0-0.84 mm)), obtained from the pyrolysis of ammonium dichromate prepared according to the procedure 35 described in U.S. Pat. No. 5,036,036, was placed in a 5/8" (1.58 cm) diameter Inconel[®] nickel alloy reactor heated in a fluidized sand bath. It was heated to 175°C in a flow of nitrogen (50 cc/min) at which time HF flow (50 cc/min) was also started through the reactor. After 15 minutes, the nitrogen flow was decreased to 20 cc/min and the HF flow increased to 80 cc/min. The reactor

temperature was gradually increased to 400°C during a 2 hour period and maintained at 400°C for an additional 30 minutes. At the end of this period the reactor was brought to the desired operating temperature for catalyst evaluation under a nitrogen flow.

- 5 The results of the chlorofluorination reaction are shown in Table 1 in area %.

EXAMPLE 5

- 5 A 15" (38.1 cm) X 1/4" (0.64 cm) O.D. Hastelloy™ C-276 nickel alloy U-tube reactor was charged with 1% Re/Acid-Washed Carbon calcined at 925°C (2.59 g, 6.25 mL). The reaction pressure was 0 psig (101.3 kPa). Results (in mol %) at various conditions are shown in Table 5.

EXAMPLE 7

- A 15" (38.1 cm) X 1/4" (0.64 cm) O.D. Inconel™ 600 nickel alloy U-tube reactor was charged with carbon which was a three-dimensional matrix carbonaceous material (2.36 g, 6.25 mL, 20-30 mesh (0.84-0.59 mm)). The reaction pressure was 0 psig (101.3 kPa) for the first Table 7 entry and 30 psig (308 kPa) for all the others. The H₂:CFC-217ba molar ratio was 4:1 for the first entry and 16:1 for all the others. Results (in mol %) at various conditions are shown in Table 7.

EXAMPLE 8

- The same reactor and catalyst as used for Example 7 was used. The reaction pressure was 0 psig (101.3 kPa) and the H₂:CFC-217ba molar ratio was 4:1. Results (in mol %) at various conditions are shown in Table 8.

CLAIMS

1. A process for the manufacture of $\text{CF}_2=\text{CFCF}_3$ and $\text{CF}_3\text{CHF}\text{CF}_3$, comprising:

- 5 (a) feeding $\text{CCl}_2=\text{CClCF}_3$, HF and Cl_2 to a first reaction zone containing a catalyst comprising trivalent chromium and operating at a temperature of at least 250°C , but not more than about 325°C , to produce a reactor effluent comprising $\text{C}_3\text{Cl}_3\text{F}_5$, $\text{C}_3\text{Cl}_2\text{F}_6$, $\text{CF}_3\text{CCl}\text{FCF}_3$, HCl and HF;
- (b) distilling the reactor effluent of (a) to produce (i) a low boiling stream comprising HCl, (ii) a reactant stream comprising an azeotrope of $\text{CF}_3\text{CCl}\text{FCF}_3$ and HF and (iii) a high-boiling stream comprising $\text{C}_3\text{Cl}_2\text{F}_6$ and $\text{C}_3\text{Cl}_3\text{F}_5$;
- 10 (c) reacting the $\text{CF}_3\text{CCl}\text{FCF}_3$ of reactant stream (ii) with hydrogen in the presence of a catalyst to produce a mixture comprising $\text{CF}_2=\text{CFCF}_3$ and $\text{CF}_3\text{CHF}\text{CF}_3$;
- 15 (d) feeding the $\text{C}_3\text{Cl}_2\text{F}_6$ and $\text{C}_3\text{Cl}_3\text{F}_5$ of high boiling stream (iii) along with HF to a second reaction zone containing a catalyst comprising trivalent chromium and operating at a temperature of at least about 375°C to produce a reaction product comprising $\text{CF}_3\text{CCl}\text{FCF}_3$ and HF; and
- (e) recycling the reaction product of (d) to the first reaction zone.
- 20 2. The process of Claim 1 wherein the $\text{CCl}_2=\text{CClCF}_3$ of (a) is derived by the chlorofluorination of $\text{CCl}_2=\text{CClCCl}_3$.
3. The process of Claim 1 wherein the hydrogenolysis of (c) is conducted in the presence of HF.

FIG. 1

INTERNATIONAL SEARCH REPORT

International Application No

PCT/US 99/07230

A. CLASSIFICATION OF SUBJECT MATTER

IPC 6 C07C17/087 C07C17/21 C07C17/23

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

IPC 6 C07C

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category *	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
Y	US 5 043 491 A (WEBSTER JAMES L ET AL) 27 August 1991 cited in the application see the whole document	1-3
Y	EP 0 539 989 A (HOECHST AG) 5 May 1993 see the whole document	1-3

☐ Further documents are listed in the continuation of box C.

☒ Patent family members are listed in annex.

* Special categories of cited documents:

"A" document defining the general state of the art which is not considered to be of particular relevance

"E" earlier document but published on or after the international filing date

"L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)

"O" document referring to an oral disclosure, use, exhibition or other means

"P" document published prior to the international filing date but later than the priority date claimed

"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

"X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

"Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.

"&" document member of the same patent family

Date of the actual completion of the international search

2 July 1999

Date of mailing of the international search report

12/07/1999
